### Communication of Progress: UN Sustainability Goals

All stakeholders and interested parties,

The year 2017 saw us draw closer to our goal of launching the greater application of the Pateo Project manifest in establishment of the community production concept. As has been the commitment of the start the very foundation of the company is to enhance global sustainability and to this end the Sustainability Goals represent the core of this and act essentially as the gatekeeper for all company decision making.

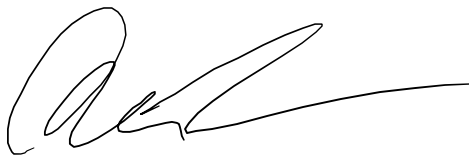

Key in this regard for 2017 is the adoption of the internal rules of Sustainability:

- All products produced will be done so in a fashion that adds no harmful emissions to the atmosphere and any factory has a net output of energy and of clean water
- Any product produced will adhere to the following:
  - Product must have a 50% longer lifespan than any benchmark alternative
  - Products must be easily fixable without technological resources
  - Products must be manufactured of at least 70% materials which are either recycled, waste materials, recyclable by our own facilities, in a cyclical system or of a non food chain competitive Biocomposite nature
  - 25% lower in emissions than benchmark products of similar nature
- All decisions and activities will be evaluated against all 17 UN Sustainability Goals and must deteriorate in zero category against benchmarks and must show improvement on benchmark in at least 7 categories

This has been adopted and agreed by all team members and communicated as part of our core communications.

Throughout 2018 as we move into production we will apply and measure these rules and report as to their application.

Sincerely,

Brendan Norman  
CEO Pateo Projects FZE
