

PLANET

Our World Under Threat

Scientists have predicted that as early as 2050, climate change could collapse human society—and the impacts are already being felt. At three times the frequency compared to half a century ago, natural disasters of increasing magnitude are destroying lives and exacerbating resource scarcity. Across Esquel's global operations, typhoons and floods have disrupted production, damaged capital, and made our workers vulnerable.

The Time for Change is Now

Recognizing the role that we, and the larger manufacturing industry play, Esquel is committed to achieving climate resilience and harmony with the planet. As a starting point, we practice efficient resource management and mobilize our 35,000 employees towards this shared goal. We further invest and innovate to mitigate environmental impact from production, with a foremost focus on reducing consumption, and cooperate with organizations at various levels to develop better industry standards. From Seed to Shirt, we actively respond to our industry's biggest environmental challenges, specifically targeting the areas of water, energy & emissions, chemicals, and waste.
